I. INTRODUCTION

PIMC with $M = \beta/\tau$ the number of timeslices of length τ.

Two-Component-Plasma (TCP) with masses $m_1 = m$ and $m_2 = 10^3 m$. N_i is the number of particles of species i and $N = \sum_i N_i$ with $x_i = N_i/N$ the molar fractions such that $\sum_i x_i = 1$.

$$\phi_{ij}(r) = \begin{cases} \epsilon_{ij}/r & r > \Sigma_{ij} \\ \infty & \text{else} \end{cases}, \tag{1.1}$$

where

$$\boldsymbol{\epsilon} = \begin{pmatrix} 1 & -1 \\ -1 & 1 \end{pmatrix}, \tag{1.2}$$

$$\boldsymbol{\Sigma} = \begin{pmatrix} 0 & \sigma/2 \\ \sigma/2 & \sigma \end{pmatrix}. \tag{1.3}$$

From Figure 2 we see the formation of clusters made of an heavy positive particle (of species 2) surrounded by a cloud of light negative particles (of species 1). We also see how changing the statistics between particles of the same species from Bose-Einstein to Fermi-Dirac makes them dislike themselves more as expected from the Pauli exclusion principle.

Note that at a given T if we choose σ too small the whole system collapses with all the negative light particles falling on the heavy positive particles.

Metallic Hydrogen

Let us consider a mixture of electrons, e, and protons, p. In reduced units we will consider $\hbar = k_B = 1$. We measure masses in units of the electron mass m_e so that the reduced mass of the electron will be $\mu_e = m_e/m_e = 1$ and the reduced mass of the proton $\mu_p = m_p/m_e \approx 1836.15$. The characteristic kinetic energy is

$$\mathscr{K} = \frac{\hbar^2}{2m_e\ell^2}, \tag{1.4}$$

FIG. 1. The partial, g_{ij}, and total, g_{tot}, radial distribution functions for a binary mixture with $N = 20, x_1 = 1/2, m_1 = 1, m_2 = 1000, \sigma = 0.4$. The mixture is in a thermodynamic state with a reduced temperature $T = T'/\mathscr{T} = 0.1$ with T' measured in degrees Kelvin and a reduced number density $n = n'\mathscr{L}^3 = 0.1$ with n' measured in cm^{-3}. In the path integral we chose $M = 20$ and used either Bose-Einstein or Fermi-Dirac statistics among like particles. In the figures $r = r'/\mathscr{L}$ where r' is measured in centimeters.

with ℓ a length. The characteristic Coulomb energy is

$$\mathscr{V} = \frac{e^2}{\ell} = \frac{2\mathscr{K}\ell}{\mathscr{L}}, \tag{1.5}$$

with e the electron charge magnitude and $\mathscr{L} \approx 5.29177 \times 10^{-9}$cm a characteristic length. Then, if we denote with n the reduced number density this will correspond to a real number density of $n\mathscr{L}^{-3}$. For example for metallic hydrogen we have a mass density $\approx 1\mathrm{g/cm}^3$ which corresponds to a reduced density of $n \approx \mathscr{L}^3/m_p \approx 0.0885943$.

The size of the nucleus of the hydrogen atom is $\approx 2 \times 10^{-13}$cm which in reduced units is $\sigma \approx 3.77945 \times 10^{-5}$.

We may then take as characteristic temperature

$$\mathscr{T} = \frac{\mathscr{K}\ell^2}{\mathscr{L}^2 k_B} \approx 315775\mathrm{K}. \tag{1.6}$$

So that for metallic hydrogen in planetary interiors an absolute temperature of $\approx 10^5$K will correspond to a reduced temperature of $T \approx 10^5/\mathscr{T} \approx 0.0316681$.

The Hamiltonian and the density matrix in reduced units will then read

$$H = -\sum_{i_e} \frac{1}{2\mu_e}\nabla^2_{i_e} - \sum_{i_e} \frac{1}{2\mu_p}\nabla^2_{i_p} + \sum_{i_e<j_e} \phi_{i_e j_e}(r_{i_e j_e}) + \sum_{i_p<j_p} \phi_{i_p j_p}(r_{i_p j_p}) + \sum_{i_e i_p} \phi_{i_e i_p}(r_{i_e i_p}), \tag{1.7}$$

$$\rho = e^{-H/T}. \tag{1.8}$$

with ϕ_{ij} given by Eq. (1.1) and distances are measured in units of $\mathscr{L}$.

FIG. 2. Snapshots of the simulation of a binary mixture with $N = 20, x_1 = 1/2, m_1 = 1, m_2 = 1000, \sigma = 0.4$. The mixture is in a thermodynamic state with a reduced temperature $T = T'/\mathscr{T} = 0.1$ with T' measured in degrees Kelvin and a reduced number density $n = n'\mathscr{L}^3 = 0.1$ with n' measured in cm^{-3}. In the path integral we chose $M = 20$ and used either Bose-Einstein (left panel) or Fermi-Dirac (right panel) statistics among like particles. Red paths are for the heavy species and black paths are for the light particles.
